COVID-19 GLOBAL IMPACT DASHBOARD

Executive Summary | VEDA Technology Internship Project

Project Overview

This project explores publicly available COVID-19 data to understand reported cases, deaths, and changes over time across countries. The workflow focuses on preparing a large time-series dataset, reviewing data quality, and presenting trends through summary tables and charts.

Dataset & Preparation

Item	Current project finding
Raw dataset	617,667 rows and 61 columns
Cleaned dataset	538,921 rows and 61 columns
Country coverage	227 countries/locations represented
Date range	1 January 2020 – 30 August 2026
Missing data	17,930,406 missing cells remain in the cleaned dataset; several indicators have substantial missingness.

Analysis & Visual Outputs

The analysis workflow creates a project summary, a missing-values report, monthly reported case/death trend charts, and country-level total cases and deaths charts. These outputs are intended to help compare reported patterns over time and across locations.

Key Observations

• The cleaned file contains fewer rows than the raw file; the exact reason for the row-count reduction should be documented from the cleaning notebook before making a specific claim.

• Missingness remains high across the dataset, and the human development index field was reported as entirely missing in the inspected data.

• Country-level totals and monthly trends can support exploratory comparison, but interpretation should account for differences in reporting coverage and missing values.

Tools & Deliverables

Tools used in the current workflow: Python, Pandas, Matplotlib, Jupyter Notebook, and CSV files. Project outputs include cleaned data, summary/missing-value CSV reports, and PNG charts. A public GitHub repository, final dashboard presentation, and LinkedIn post should only be marked complete after they have actually been published.

Conclusion: The project establishes a data-cleaning and exploratory-analysis workflow for COVID-19 reporting data. The next priority is to verify the row-removal logic, present 3–5 concise insights, and publish the required deliverables with a clear README.

Prepared for internship submission | Findings are based on the dataset checks and workflow described by the project owner.
